100% of respondents answered **No** when asked if information about waste sorting and management systems is easy to access.

This strongly supports the foundation of Astemon’s concept: there is a clear lack of centralized and user-friendly waste information in English.

The response shows that newcomers feel disconnected from the existing systems due to language barriers and fragmented online resources.

When asked about their familiarity with how the waste sorting system works, 50% said **they only know the basics**, while the other 50% admitted **they are not familiar at all**.

This confirms that even though newcomers may want to recycle, they often lack the understanding of the color-coded bin system.

It supports our projects cause of creating awareness around the sorting system.

50% of participants said they **would definitely use an English application** that explains Lisbon’s waste system in an understandable way, while the remaining 50% said maybe.

This shows an interest towards a solution like Astemon. Even those who answered maybe likely reflect uncertainty about actually using such an application, not a lack of the need.

The overall result suggests that there is a demand for a multilingual, easy-to-use digital platform that combines visual guidance and accessibility.

The question: **How do you usually deal with your waste in Lisbon?** Is also very important to look into, because it proves that the majority of the participants don’t actually sort their waste. With answers being mostly: *“One big bad usually”, “One big bag with everything”, “One big bag - i dont sort”, “At home one big bag, while outside try to find a matching bin to your trash”, “Threw everything in one big bag”*

This also supports the need to create more awareness! Which is the core point in our project!! We need to make people sort more at home.

When asked how important waste sorting is personally, most (57.1%) rated it as a 3 out of 4, while 21.4% rated it as 4, and the remaining 21.4% as 2. None of the participants selected the lowest value.

This indicates that most people already care about waste sorting and recognise its importance in daily life. However, despite this positive attitude, the previous survey results show that many still struggle to find clear and accessible information about how to do it correctly in Lisbon. **This gap between motivation and understanding reinforces the need for awareness tools like Astemon**, which make recycling easier and more intuitive for those who genuinely want to contribute but lack proper guidance.

The survey results clearly show that most people find waste sorting information in Lisbon inaccessible and difficult to understand, especially for non-Portuguese speakers. Despite this, the responses also reveal a strong willingness to learn. Half of the participants said they would definitely use an English application about waste sorting, while the other half said they might. This demonstrates not a lack of motivation, but a lack of clear tools and guidance.

From the results it is clear that there is a need and a demand for a platform like Astemon. One that makes information more accessible, provides clear visual guidance, and raises awareness about waste sorting. People want to recycle and do their part for the environment; they just need the right support and information to make it easy and achievable.
